Practical – 6

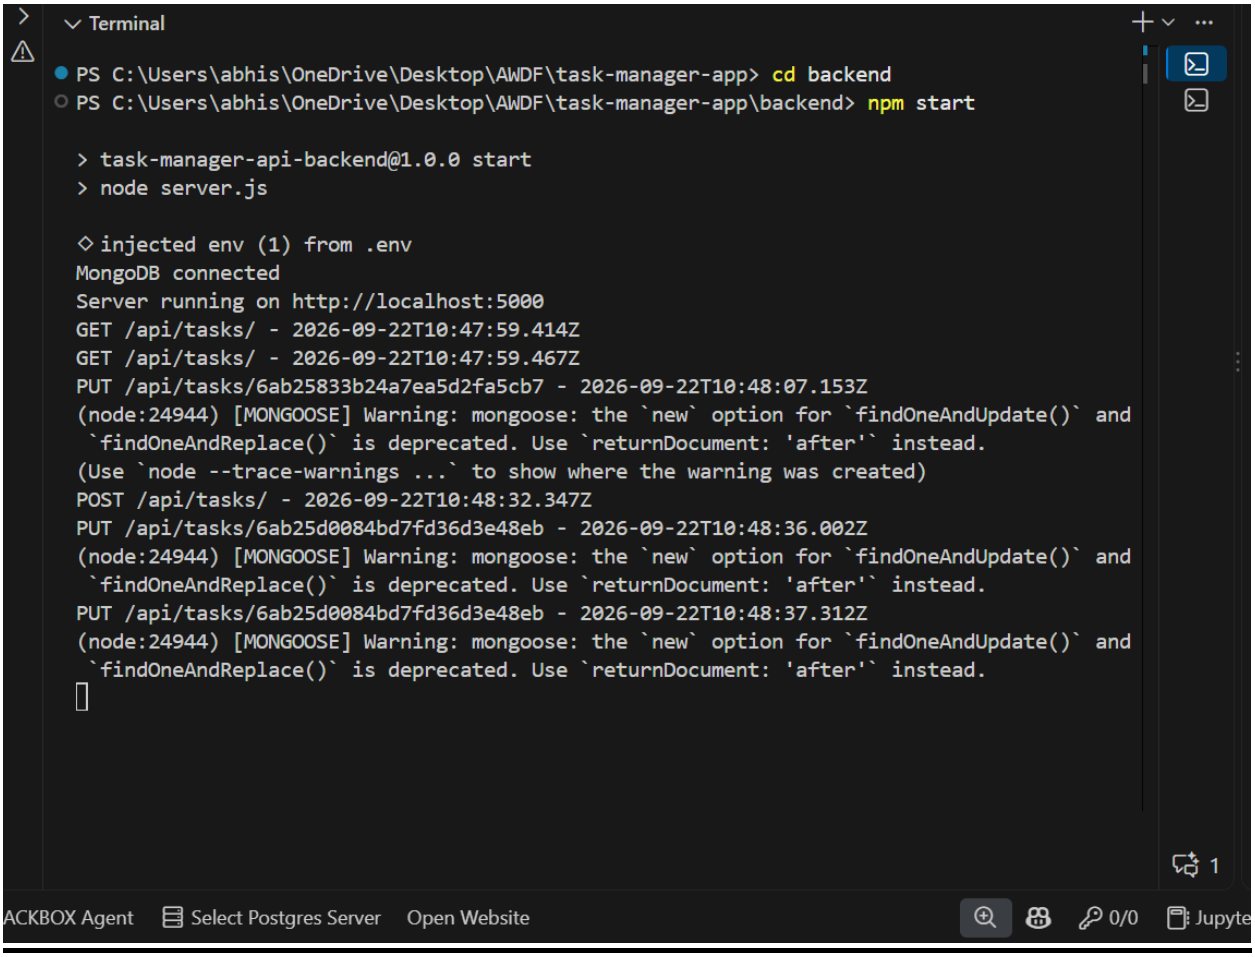

Aim:

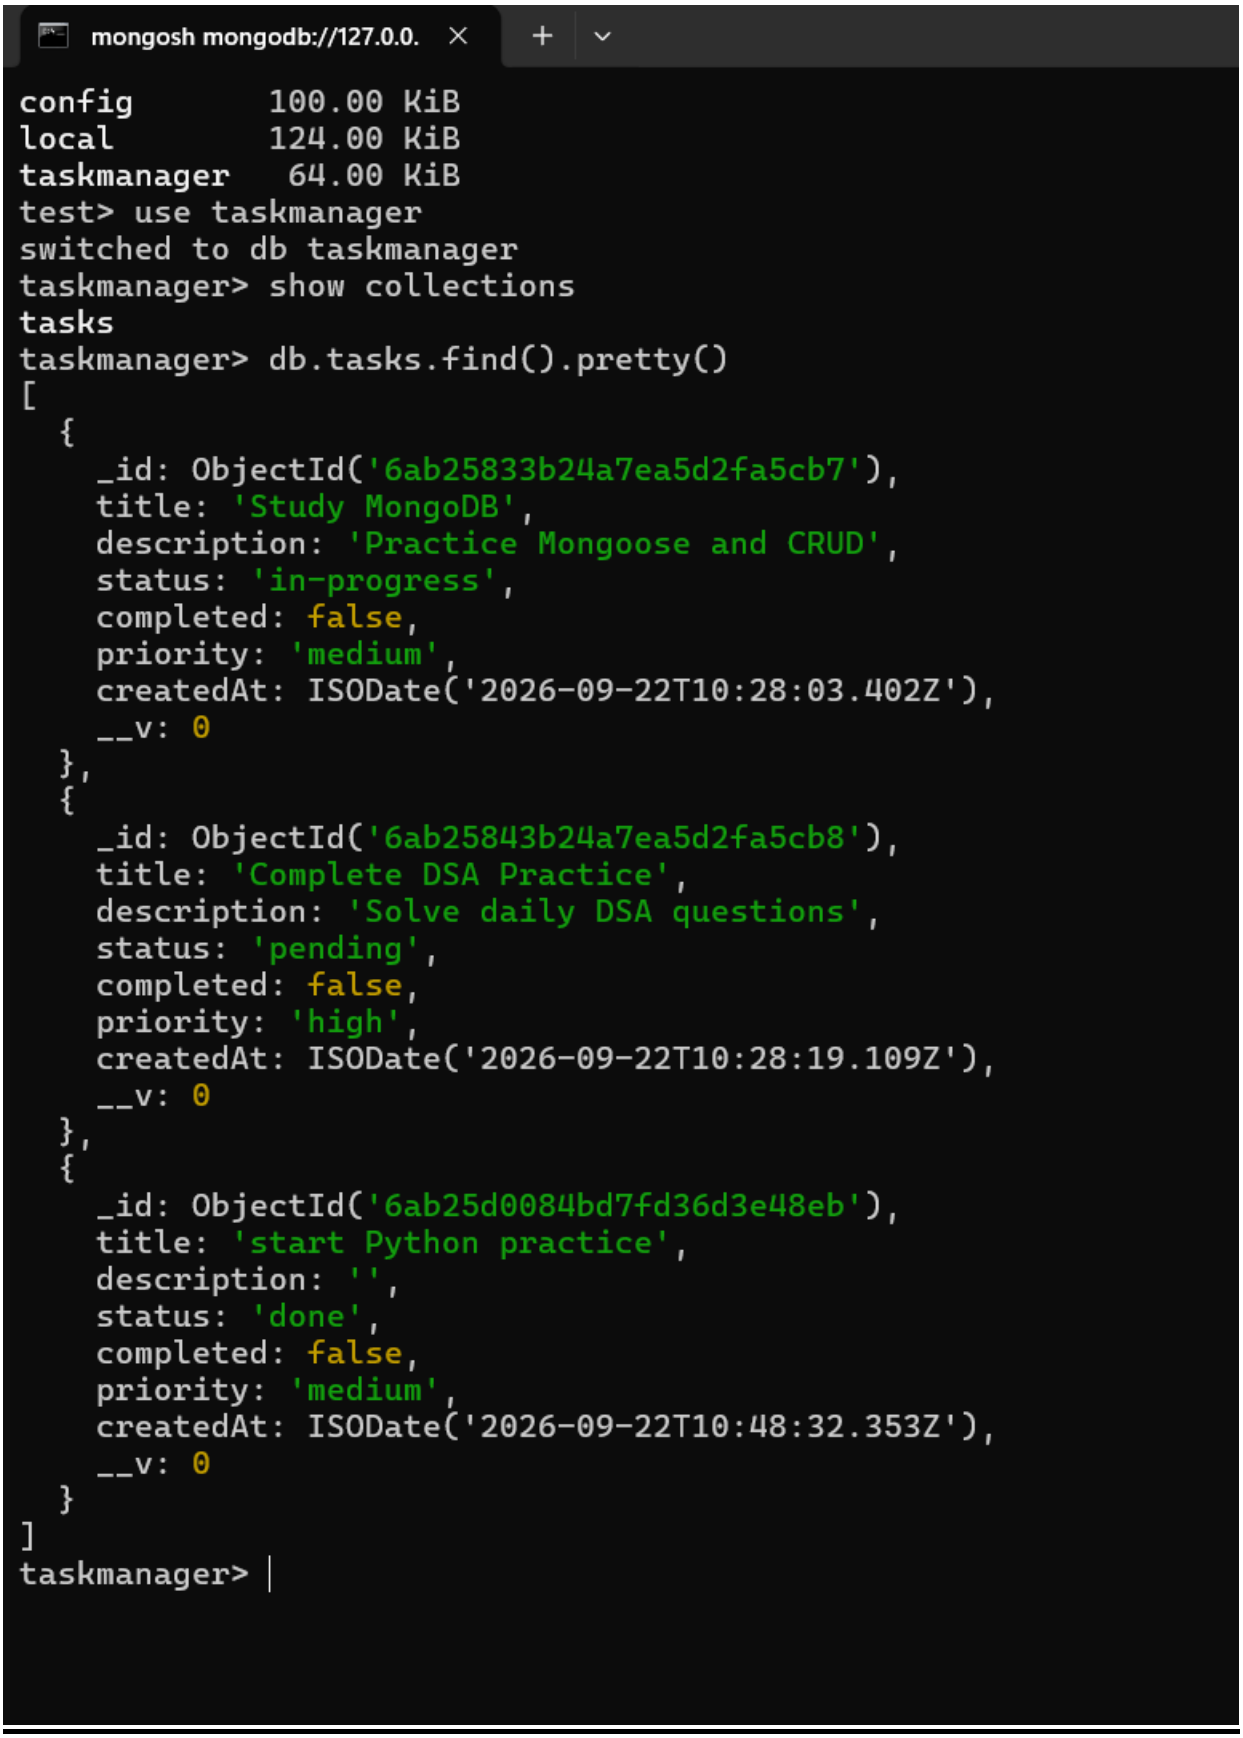

To wire the React frontend to the Node/Express/MongoDB backend into a fully functional full-stack application.

Content:

After completing this practical, I will be able to build a full-stack task management application using React, Node.js, Express.js, MongoDB, and Mongoose. I will learn to connect the frontend with the backend, perform CRUD operations, manage application state, handle errors, configure CORS, and synchronize task data with MongoDB. This practical will help me develop reliable and maintainable full-stack web applications.

Screen Shot:

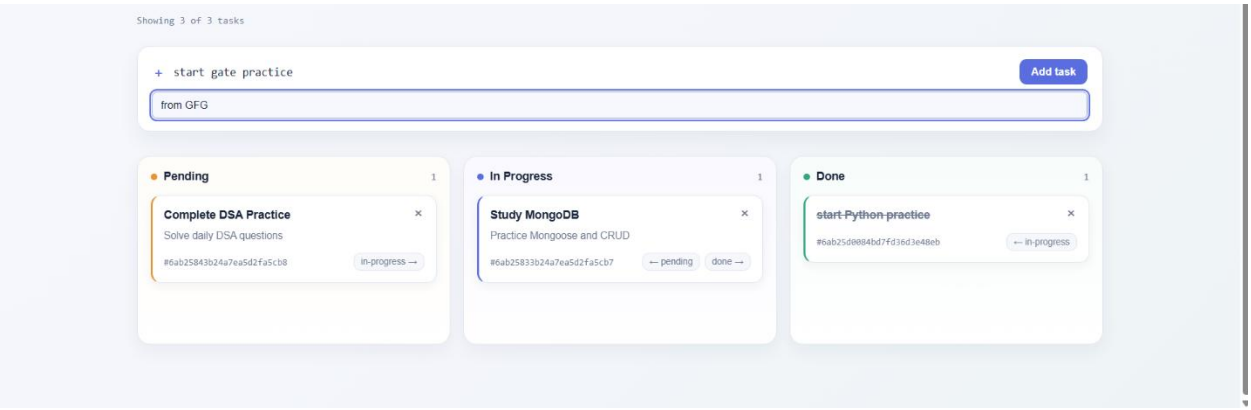

mongosh mongodb://127.0.0.
config 100.00 KiB
local 124.00 KiB
taskmanager 64.00 KiB
test> use taskmanager
switched to db taskmanager
taskmanager> show collections
tasks
taskmanager> db.tasks.find().pretty()

Task deleted

Conclusion:

This practical demonstrates a full-stack Task Management application using React, Node.js, Express.js, MongoDB, and Mongoose. It connects the React frontend with the backend to perform task CRUD operations through REST APIs.It also covers CORS, API integration, state management, loading and error handling, delete confirmation, and notifications. Tasks are stored in MongoDB and tested through create, update, delete, and refresh operations.
